

# A DEVELOPER'S PARADISE THE ULTIMATE HTML5 CHEAT SHEET

# Standard Structure

# </html>

<html> ... These tags are used at the beginning and end of an HTML document. This is known as the "root element." Using these tags tells the website that the web page is being written in HTML5, and that all the other tags within these are HTML formatted.

</head>

<head> ... Use these to group information specific to the page. This includes title tags, meta descriptions, and links to both script and style sheets.

This is used for the title tag of the page. Here you'll place a title that is useful to both search engines and users.

</body>

<body> ... Between these tags is where you'll place all the content for users. This includes text, images, and graphic elements.

# Here's what a typical layout looks like:

<html>

<head><title>HTML 5 Cheat Sheet</title>

</head><body> Your content </body>

</html>

### <base/>

Signifies the Base URL and specifies all relative links in the document.

### <meta/>

Includes additional information about the page. This includes descriptions, author, publish date, keywords, and other "off-page" information.

### k/>

Creates association with external pages like style sheets.

### <style> ... </style>

Used to include document style information which is usually CSS.

### <script> ... </script>

All the information or links to external scripts.

### Here's an Example:

```
<html>
  <head>
     <meta charset="utf-8">
     <base href="http://www.mywebsite.com" target="_blank"/>
     <title>My Website</title>
     k rel="stylesheet" href="/css/master.css">
<script type="text/javascript">
   Var MyVar = 0;
</script>
</head>
<body>
Your content
</body>
</html>
```

# Formatting your Text

# <strong> .. </strong>

Places strong emphasis on something (displays in bold on browsers)

# <em> ... </em>

The emphasis tag. Turns text into italics for on browsers.

### <cite> ... </cite>

This highlights references information. Good for quotes and statements.

# <del> ... </del>

Labels a previously deleted portion of text.

# <blookguote> ..... </blockguote>

These are used for long paragraphs of quotation which are commonly cited as well.

# <br/>

This creates a line break used for writing blocks of text on different lines.

# <sub> ... </sub>

Subscript text that is smaller and placed a half-line lower than previous text.

# <b> ... </b>

Also creates bold text, but not as effective as the tag above.

# <i> ... </i>

An alternate way to create italics, but mainly used for thoughts or names.

# ...

Monospace text laid out with the whitespace inside the element intact.

# <ins> ... </ins>

Shows a section that has been inserted into the content.

# <q> ... </q>

Used for shorter quotations.

# <hr/>

Create a horizontal rule or sectional break. This is u to create a change in topic or section on the page.

# <sup> ... </sup>

Superscript text which is half a line higher than previous text.

# **TEXT FORMATTING**

# This text is bold

This text is italic

This text is superscript

<h1 - h6>

These are the six levels of headings </h1 - h6> on a page. One is the most important and six is the least.

# <div> ... </div>

Containers used to label a page section orthe placement of an element.

# <span> ... </span>

Inline labels used to grouping style elements.

# ...

Used to organize paragraphs of text.

# **Example of Text and Document Formatting**

<div> <h1>How to start a blog</h1>

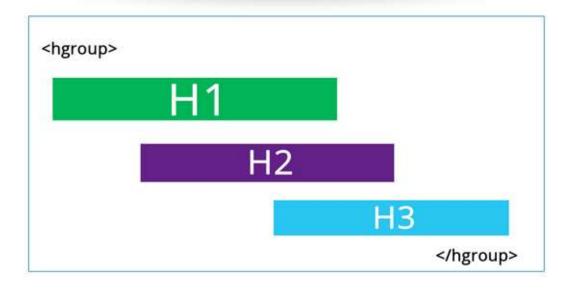

So you have this idea, and you want to <strong>create a blog</strong>. Well, today I'm going to show you how to make that happen.

<hr/>

<h2>Start With an Idea</h2>

It all begins with a topic you want to cover in your new blog. Remember, your topic is <em>the soul of your blog</em. It has to be something you're <span>passionate about</span>.

</div>

<img /> This tag is used to display image files.

src="url" The URL or file name of the image being displayed.

### alt="text"

Alternative text used to explain image content to both search engines and users.

# height=""

Used to specific image height in either pixels or percentages.

### Width=""

Specify width in pixels or percentages.

### Align=""

Where to align the image relative to other elements on the page.

### Border=""

Specifies border thickness (if any).

# vspace=""

Denote spacing on the left or right side of the image.

# hspace=""

Spacing on the top or bottom of the image.

### <map> ... </map>

Informs users that an interactive image is present with clickable areas.

### <map name="">... </map>

The name of the map between the image and the map itself.

# <area />

The image area of an image map.

### Example of Images

<img src="planets.gif" width="140" height="120" alt="planets" usemap="#planetmap">

<map name="planetmap">

<area shape="rect" coords="0,0,82,126" href="sun.htm" alt="Sun">
<area shape="circle" coords="90, 58, 3" href="mercur.html" alt="mercury">
<area shape="circle" coords="124, 58, 8" href="venus.htm" alt="venus">
</map>

... 
 Numbered lists in sequential order.

 <l>

 <l>

<|i>... </|i> Specify each item to be bulleted or numbered.

<dl> ... </dl> List item definitions.

<dt> ... </dt> Defines a single term inline with body content.

<dd>... </dd> A description for a defined term.

# **Example of Listing**

<0|>

One

Two

Three

Four

Bacon

Eggs

Pancakes

<dl>

<dt>Cofee</dt>

<dd>Hot or iced drink, black</dd>

<dt>Milk</dt>

<dd>White, cold drink</dd>

</dl>

<a href=""> ... </a>

Creates a hyperlink with defined anchor text.

... </a>

<a href="mailto:"> A link that pulls up an outgoing messages to a specific email address.

<a href= "tel://###-"> ... </a>

A link that makes numbers clickable. Great for mobile users.

<a name=""> ... </a>

Anchor text used to bring users to a specific place in a document.

... </a>

<a href="#name"> Anchor text used to bring users to a div element.

# Example of Link

<a href="www.onblastblog.com">On Blast Blog</a>

# **HTML5** ADDING FORMS AND TABLES

# Formatting your Text

<form> ... </form> Tags used to create a form. Combined with attributes to show how the form will operate.

method=""

Refers to the HTTP method and how to send the form data.

Autocomplete Turns autocomplete on or off on the

Accept-charsets Identifies character encoding on the form submission.

<fieldset> .... </fieldset> Identifies the group of all fields on the form.

<legend> .... </legend>

A caption for the fieldset element.

action="url"

Shows where data is sent when a visitor submits the form.

enctype=""

Dictates how the form data is supposed to be encoded whensubmitting information to the web server. Only used with method="post".

Novalidate Defines whether the form should be validated when submitted.

Target

Used to show where the form response should be displayed after being submitted. Used with \_blank, \_self, \_parent\_top

<label> ... </label>

A label telling the user what to enter in each field.

<input />

The input attribute shows what type of field information to receive from users.

type=""	Specifies field input type, including text, password, date-time, checkbox, etc.	name=""	The name of the form
value=""	The value of input field information.	size=""	The input element width in characters
maxlength	="" Maximum input element characters allowed.	Required	Tag used to ensure the <input/> element is completed before submitting the form.
step=""	The number intervals for an input field.	width=""	Width in pixels of an <input/> element.
height=""	Height in pixels of an <input/> element.	placeholo	ler="" A hint for users showing what the <input/> element value should be.
pattern=""	Checks the input against a defined value to ensure the information is correct.	min=""	The minimum value of an <input/> element.
max=""	The maximum value of an <input/> element.	Autofocu	S Ensures the <input/> element comes into focus once a page loads.
Disabled	Disables an <input/> element on the form.	<textarea  <td><ul> <li>Specifies a large text input for longe rea&gt; messages.</li> </ul></td></textarea 	<ul> <li>Specifies a large text input for longe rea&gt; messages.</li> </ul>
<select> </select>	Drop-down box for users to select from options.		

# (To be Used in </select> Tags)

name=""	The title for a drop-down combination box.	size=""	The number of options in a drop-down box.
Multiple	Allows multiple sections to be made at one time.	Required	Requires a value to be selected before a user can submit a form.
<optgroup> </optgroup>	available options.	<option> </option>	Defines one of the available options in the drop-down list.

# **Option Attributes**

value=""	Explains an option's value available for	Selected	Shows the default selection option for
	selection.		users.

<button> ... Shows the clickable button for users to <button> submit options.

# Example of Form

```
<form action="action_page.php" method="post">
  <fieldset>
  <legend>basic information:</legend>
  First name:<br>
  <input type="text" name="firstname" value="Matt"
placeholder="First Name"><br>
  Last name: <br>
  <input type="text" name="lastname" value="Banner"
placeholder="last name"><br><br>
  Blog topic:<br>
  <select>
     <option value="cooking">Cooking</option>
     <option value="SEO">SEO</option>
     <option value="Fashion">Fashion</option>
     </select>
<textarea name="description"></textarea>
<input type="submit" value="Submit">
</fieldset>
</form>
```

# (To be Used in </select> Tags)

<aption> A description of the table's purpose and the information it contains.</aption>
The body of the table data or  information.
Content within a single table cell.
<col/> A single column of information within a table.

# An Example of Table Formatting

```
<colgroup>
   <col span="2" style="background-color:
#182afb">
  <col style="background-color: #2f1475b">
</colgroup>
Blog title
 URL
 DA
On Blast Blog
 www.onblastblog.com
 52
```

# Objects

<object> ... </object>

Describes a file type to be embedded (audio, video, PDFs, etc.). height="" The height of the object.

width=""

Width of the object.

type="" The type of media the object contains.

usemap=""

The name of the client-side image map within the <object> tag.

# iFrames formatting

<iframe>

</iframe>

An inline frame that allows external information to be embedded into a document.

name="" The name of the <iframe>

src=""

The source URL for the object within the <iframe>.

srcdoc="" The HTML content within the frame.

Width=""

The width of the <iframe>.

<param /> Adds extra parameters to help customize the iframe's content.

<embed>

A container for another external ... </embed> application or plug-in. Embed can also be used with the height, width, src, and type tags above.

# Examples

<object width="425" height="225"></object> <iframe src="blogging\_iframe.htm" width="300" height="600"></iframe> <embed src="bringonblogging.swf" width="400"</p> height="800"></embed>

<header> The header block for a document </header>	<footer> The footer block for a document </footer> or section.
<main> The main content of a document </main>	<article> Identifies an article within a </article> document.
<aside> </aside> For content contained in a sidebar.	<pre><section></section></pre>
<pre><details> Additional facts or information that </details> users can view/hide.</pre>	<dialog> A box or window for dialog </dialog>
<pre><figcaption></figcaption></pre>	<pre><figure> A content block featuring diagrams </figure> photos,illustrations, and more.</pre>
<mark> Displays highlighted text within the content.</mark>	<nav> Navigation links for users </nav>
<menuitem/> The menu item a user can raise from a popup menu.	<meter> The scalar measurement within a </meter> known array.
<pre><pre>copress</pre></pre>	<rp>  Display text in browsers that don't support ruby annotations.</rp>
<rt> </rt> Display East Asian typography character details.	<pre><ruby> A Ruby annotation for East Asian </ruby></pre> <pre>typography.</pre>
<summary> Contains a heading for a </summary> <details> element.</details>	<pre>Format part of text in a different direction from other text.</pre>

<wbr>>

<time> ...

</time>

Identifies time and date.

A line break within content.

# **HTML5** CANVAS ELEMENTS

HTML <canvas> element is used to draw graphics on the fly via scripting (most commonly JavaScript). The <canvas> element is a container for graphics, you must use a script to draw the graphics themselves.

# **CANVAS ELEMENT**

Attributes

Width - unsigned long (Default: 300)

Height - unsigned long (Default: 150)

Methods

String - to DataURL( [Optional] string type [variadic] any args)

Object - getContext(string contextId)

# **2D CONTEXT**

Attributes

Canvas - HTMLCanvasObject [readonly]

Methods- Void - save() Void - restore()

# TRANSFORMATION

# Methods

Void - scale(float x, float y)

Void - rotate(float angle)

Void - translate(float x, float y)

Void - transform(

Float m11, float m12, float m21

Float m 22, float dx, float dy)

Set transform

(Float m11, float m12, float m21 Float m22, float dx, float dy)

# **IMAGE DRAWING**

### Methods

Void - drawlmage(

Object image, float dx, float dy [optional] float dw, float dh)

Argument "image" can be of type HTMLImage Element, HTMLCanvasElement, or HTMLVideo Element

Void - drawlmage(

Object image, float sx, float sy, float sw, float sh, float dx, float dy, float dw, float dh)

# LINE STYLE

### Attributes

Linewidth - float (Default: 1.0) Linecap - string (Default: butt)

Supports the LineJoin - string (Default:

miter)

following values: Supports the following

Round Round Square Bevel
MiterLimit - float (Default: 10)

# **COLORS, STYLES, AND SHADOWS**

### Attributes

strokeStyle - any type (Default: black) fillStyle - any type (Default: black) shadowOffsetX - float (Default: 0.0) shadowOffsetY - float (Default: 0.0)

shadowBlur - float (Default 0.0)

shadowColor - string (Default: transparent

black)

### Methods

CanvasGradient - createLinearGradient(float x0, float y0, float x1, y1)

CanvasGradient - createRadialGradient(

Float x0, float y0, float r0, float x1, float y1,

float r1)

CanvasPattern - createPattern(Object image, string repetition)

Repetition supports any of the following values: repeat, repeat-x, repeat-y, no-repeat)

# COMPOSITING

# Attributes

GlobalAlpha - float (Default 1.0) GlobalCompositeOperation - string (Default: source-over)

# Supports the following values:

Source-over

Source-in

Source-out

Source-atop

Destination-over

Destination- in

Destination-out

Destination-atop

Lighter

Copy

Xor

# TEXT

# Attributes

Font (type: string) Default: 10px sans-serif

TextAlign (type: string) Default: start

(supports any of the following values: start, end,

left, right, center)

TextBaseline (Type: string) Default: alphabetic (Supports the following values: top, hanging, middle, alphabetic, ideographic, bottom)

# Methods

Void - fillText (string text, float x, float y, (optional) float maxwidth)

TextMetrics - measureText (string text)

# TEXTMETRICS INTERFACE

Width - float (Default: reasonly)

# RECTANGLES

### Methods

Void - clearRect(float x, float y, float w, float h) Void - fillRect(float x, float y, float w, float h) Void - strokeRect(float x, float y, float w, float h)

# PATHS

beginPath()
closePath()
fill()
stroke()
clip()
moveTo(float x, float y)
lineTo(float x, float y)
quadraticCurveTo(float cpx, float cpy, float x,
float y) bezierCurveTo( float cp1x, float cp1y,
float cp2x, float cp2y, float x, float y) arcTo
(float x1, float y1, float x2, float y2, float radius)
arc( float x, float y, float radius, float startAngle,
float endAngle, boolean anticlockwise)
rect(float x, float y, float w, float h)
isPointInPath(float x, float y)

# **PIXEL MANIPULATION**

### Methods

ImageData - createImageData(float sw, float sh)
ImageData - createImageData(ImageData imagedata)
ImageData - getImageData(float sx, float sy, float sw, float sh)

Void - putImageData( ImageData imagedata, float dx, float dy, [Optional] float dirtyX, float dirtyY, float dirty-Width, float dirtyHeight)

# CanvasPixelArray Interface

Length - unsigned long (Default: readonly)

# ImageData Interface

Width - unsigned long (Default: readonly) Height - unsigned long (Default: readonly) Data - CanvasPixelArray (Default: readonly

# Which HTML5 tags affect SEO?

- Cont extual Highlighting With <mark>
- Lower Importance with <small>
- Quotations With <q> and <blockquote>
- Insertion, Deletion, and Correction With <ins>,del> and <s>
- Organizing Options with <optgroup>
- Predefined Options With <datalist>

### #2 - HTML 5 is Bad For Video

- Some webmasters still prefer to use Flash for embedding video content.
- HTML5 allows you to add SEO-friendly labels, captions, and subtitles on your videos.
- These same parameters can be used for images (alt-text, captions, etc.)

# HTML5 SEO Myths Debunked

# #1 - HTML5 Does Not Help Rankings

- HTML5, like previous versions, does benefit SEO
- Special elements are used to make it easier for search engines and bots to understand the intent of elements themselves. These are known as Semantic elements.

# #3 - You Can Only Use H1 Tag

- For each new content section, you can use a H1 tag.
- Any header tag you deem necessary is fine.
- Use a traditional tag hierarchy (H2, H3, and so on)
